Keywords XXX, XXX

TODO: equivalence relation for $\lambda_{\rm ZFC}$ terms, that at least handles divergence

1. Introduction

- 1. Define the *bottom arrow*, type $X \Rightarrow Y_{\perp}$, a compilation target for first-order functions that may raise errors.
- Derive the mapping arrow from the bottom arrow, type X → Y. Its instances return extensional functions, or mappings, that compute the same values as their corresponding bottom arrow computations, but have observable domains.
- Derive the preimage arrow from the mapping arrow, type X pre Y. Instances compute preimages under their corresponding mapping arrow instances.
- 4. Derive XXX from the preimage arrow. Instances compute conservative approximations of the preimages computed by their corresponding preimage arrow instances.

Only the first and last artifacts—the bottom arrow and the XXX—can be implemented.

2. Mathematics and Metalanguage

From here on, significant terms are introduced in **bold**, and significant terms we invent are introduced in **bold italics**.

We write all of the mathematics in this paper in $\lambda_{\rm ZFC}$ [1], an untyped, call-by-value lambda calculus designed for manually deriving computable programs from contemporary mathematics.

Contemporary mathematics is generally done in **ZFC**: **Zermelo-Fraenkel** set theory extended with the axiom of **Choice** (equivalently unique **Cardinality**). ZFC has only first-order functions and no general recursion, which makes

implementing a language defined by a transformation into contemporary mathematics quite difficult. The problem is exacerbated if implementing the language requires approximation. Targeting $\lambda_{\rm ZFC}$ instead allows creating a precise mathematical specification and deriving an approximating implementation without changing languages.

In $\lambda_{\rm ZFC}$, essentially every set is a value, as well as every lambda and every set of lambdas. All operations, including operations on infinite sets, are assumed to complete instantly if they terminate.¹

Almost everything definable in contemporary mathematics can be formally defined by a finite $\lambda_{\rm ZFC}$ program, except objects that most mathematicians would agree are nonconstructive. More precisely, any object that *must* be defined by a statement of existence and uniqueness without giving a bounding set is not definable by a *finite* $\lambda_{\rm ZFC}$ program.

Because $\lambda_{\rm ZFC}$ includes an inner model of ZFC, essentially every contemporary theorem applies to $\lambda_{\rm ZFC}$'s set values without alteration. Further, proofs about $\lambda_{\rm ZFC}$'s set values apply to contemporary mathematical objects.²

In $\lambda_{\rm ZFC}$, algebraic data structures are encoded as sets; e.g. a *primitive ordered pair* of x and y is $\{\{x\}, \{x,y\}\}$. Only the *existence* of encodings into sets is important, as it means data structures inherit a defining characteristic of sets: strictness. More precisely, the lengths of paths to data structure leaves is unbounded, but each path must be finite. Less precisely, data may be "infinitely wide" (such as \mathbb{R}) but not "infinitely tall" (such as infinite trees and lists).

We assume data structures, including pairs, are encoded as *primitive* ordered pairs with the first element a unique tag, so that they can be distinguished by checking tags. Accessors such as fst and snd are trivial to define.

 $\lambda_{\rm ZFC}$ is untyped so its users can define an auxiliary type system that best suits their application area. For this work, we use an informal, manually checked, polymorphic type system characterized by these rules:

- A free lowercase type variable is universally quantified.
- \bullet A free upper case type variable is a set.
- A set denotes a member of that set.
- $x \Rightarrow y$ denotes a partial function.

1

- $\langle x, y \rangle$ denotes a pair of values with types x and y.
- \bullet $\mathsf{Set}\ \mathsf{x}$ denotes a set with members of type $\mathsf{x}.$

The type Set A denotes the same values as the powerset \mathcal{P} A, or *subsets* of A. Similarly, the type $\langle A,B\rangle$ denotes the same values as the product set $A\times B$.

 $^{[{\}it Copyright notice will appear here once 'preprint' option is removed.}]$

 $^{^1}$ An example of a nonterminating $\lambda_{\rm ZFC}$ function is one that attempts to decide whether other $\lambda_{\rm ZFC}$ programs halt.

² Assuming the existence of an inaccessible cardinal.

We write $\lambda_{\rm ZFC}$ programs in heavily sugared λ -calculus syntax, with an if expression and these additional primitives:

$$\begin{array}{lll} \mathsf{true} : \mathsf{Bool} & (\in) : \mathsf{x} \Rightarrow \mathsf{Set} \; \mathsf{x} \Rightarrow \mathsf{Bool} \\ \mathsf{false} : \mathsf{Bool} & \mathcal{P} : \mathsf{Set} \; \mathsf{x} \Rightarrow \mathsf{Set} \; (\mathsf{Set} \; \mathsf{x}) \\ \varnothing : \mathsf{Set} \; \mathsf{x} & \bigcup : \mathsf{Set} \; (\mathsf{Set} \; \mathsf{x}) \Rightarrow \mathsf{Set} \; \mathsf{x} \\ \omega : \mathsf{Ord} & \mathsf{image} : (\mathsf{x} \Rightarrow \mathsf{y}) \Rightarrow \mathsf{Set} \; \mathsf{x} \Rightarrow \mathsf{Set} \; \mathsf{y} \\ \mathsf{take} : \mathsf{Set} \; \mathsf{x} \Rightarrow \mathsf{x} & \mathsf{card} : \mathsf{Set} \; \mathsf{x} \Rightarrow \mathsf{Ord} \end{array}$$

Shortly, \varnothing is the empty set, ω is the cardinality of the natural numbers, take removes the member from a singleton set, (\in) is an infix operator that decides membership, $\mathcal P$ returns all the subsets of a set, \bigcup returns the union of a set of sets, image applies a function to each member of a set and returns the set of return values, and card returns the cardinality of a set.

We assume literal set notation such as $\{0,1,2\}$ is already defined in terms of set primitives.

2.1 Internal and External Equality

Set theory extends first-order logic with an axiom that defines equality to be extensional, and with axioms that ensure the existence of sets in the domain of discourse. $\lambda_{\rm ZFC}$ is defined the same way as any other operational λ -calculus: by (conservatively) extending the domain of discourse with expressions and defining a reduction relation.

While $\lambda_{\rm ZFC}$ does not have an equality primitive, set theory's extensional equality can be recovered internally using (\in). *Internal* extensional equality is defined by

$$x = y := x \in \{y\} \tag{2}$$

which means

$$(=) := \lambda x. \lambda y. x \in \{y\}$$
 (3)

Thus, 1=1 reduces to $1\in\{1\}$, which reduces to true.³ Because of the particular way $\lambda_{\rm ZFC}$'s lambda terms are defined, for two lambda terms f and g, f = g reduces to true when f and g are structurally identical modulo renaming. For example, $(\lambda x. x) = (\lambda y. y)$ reduces to true, but $(\lambda x. 2) = (\lambda x. 1 + 1)$ reduces to false.

We understand any $\lambda_{\rm ZFC}$ term e used as a truth statement as shorthand for "e reduces to true." Therefore, while the terms $\{(\lambda x. x) \ 1, \ 1\}$ and $\{1\}$ are (externally, extensionally) unequal, we can say that $\{(\lambda x. x) \ 1, \ 1\} = \{1\}$.

Any truth statement e implies that e converges. We sometimes do not want this, particularly when we want to say that e_1 and e_2 are equivalent when they both diverge. In these cases, we use a slightly weaker equivalence.

Definition 1 (observational equivalence). Two λ_{ZFC} terms e_1 and e_2 are **observationally equivalent**, written $e_1 \equiv e_2$, when $e_1 = e_2$ or both e_1 and e_2 diverge.

It could be helpful to introduce even coarser notions of equivalence, such as applicative or logical bisimilarity. However, we do not want internal equality and external equivalence to differ too much. We therefore introduce type-specific notions of equivalence as needed.

2.2 Additional Functions and Forms

XXX: lambda syntactic sugar: automatic currying (including the two-argument primitives (\in) and image), matching, sectioning rules

XXX: set syntactic sugar: set comprehensions, cardinality, indexed unions

XXX: functions: \cup , \cap , \setminus , \subseteq

(
$$\uplus$$
) : Set $x \Rightarrow$ Set $x \Rightarrow$ Set $x \Rightarrow$ A \uplus B := if (A \cap B = \varnothing) (A \cup B) (take \varnothing) (4)

XXX: logic: logical operators and quantifiers

In set theory, functions are encoded as sets of inputoutput pairs. The increment function for the natural numbers, for example, is $\{\langle 0,1\rangle,\langle 1,2\rangle,\langle 2,3\rangle,...\}$. To distinguish these hash tables from lambdas, we call them *mappings*, and use the word **function** for either a lambda or a mapping. For convenience, as with lambdas, we use adjacency (i.e. (f x)) to apply mappings.

The set $X \rightharpoonup Y$ contains all the *partial* mappings from X to Y. For example, $X \rightharpoonup Y$ is the return type for the restriction function:

which converts a lambda or a mapping to a mapping with domain $A \subseteq X$. To create mappings using lambda syntax, we define $\lambda x \in A$. e as shorthand for $(\lambda x.e)|_A$.

Figure 1 defines more operations on partial mappings: domain, range, preimage, pairing, composition, and disjoint union. The latter three are particularly important in the preimage arrow's derivation, and preimage is critical in measure theory's account of probability.

XXX: lazy mappings

3. The Bottom Arrow

XXX: motivation:

- derive preimage arrow from something simple and obviously correct
- eventually define functions that may diverge using this arrow; use derivation to do the same with the preimage arrow
- will be implemented to run programs on domain samples

XXX: Figure 2 defines the bottom arrow...

XXX: the standard Kleisli conversion of the Maybe monad (using a \perp instead of Just and Maybe), simplified; arrow laws therefore hold (XXX: check terminology)

In a nonstrict or simply typed λ -calculus, if $_{\perp}$ can be defined using the other combinators and a function choose: $\langle \mathsf{Bool}, \langle \mathsf{X}, \mathsf{X} \rangle \rangle \Rightarrow \mathsf{X}$, whose boolean input determines which of the $\langle \mathsf{X}, \mathsf{X} \rangle$ it returns. However, λ_{ZFC} is call-by-value, so we need an explicitly lazy conditional. We would have had to define if $_{\perp}$ in Section XXX (implementation) anyway, because the preimage arrow's lift returns unimplementable functions.

XXX: point out that if_{\perp} receives thunks, and remind readers that $1=\{0\}$

4. Deriving the Mapping Arrow

XXX: intermediate step between the bottom and preimage arrows; will not be implemented (no approximation will be implemented, either); computations are in terms of mappings, on which we can apply theorems from measure theory directly

XXX: the type of mapping arrow computations

$$X \underset{\text{map}}{\leadsto} Y ::= \text{Set } X \Rightarrow (X \rightarrow Y)$$
 (6)

XXX: notice $X \rightharpoonup Y$, not $X \rightharpoonup Y_{\perp}$

 $[\]overline{^3}$ Technically, $\lambda_{\rm ZFC}$ has a big-step semantics, and $1\in\{1\}$ can be extracted from the derivation tree for 1=1.

Figure 1: Operations on mappings.

```
\begin{array}{l} \mathsf{arr}_\bot : (\mathsf{X} \Rightarrow \mathsf{Y}) \Rightarrow (\mathsf{X} \Rightarrow \mathsf{Y}_\bot) \\ \mathsf{arr}_\bot \ f \ := \ f \\ \\ (\ggg_\bot) : (\mathsf{X} \Rightarrow \mathsf{Y}_\bot) \Rightarrow (\mathsf{Y} \Rightarrow \mathsf{Z}_\bot) \Rightarrow (\mathsf{X} \Rightarrow \mathsf{Z}_\bot) \\ \mathsf{(f}_1 \ggg_\bot \ f_2) \ x \ := \ \mathsf{if} \ (\mathsf{f}_1 \ x = \bot) \bot \ (\mathsf{f}_2 \ (\mathsf{f}_1 \ x)) \\ \mathsf{pair}_\bot \ f \ f_2 \ x \ := \ \mathsf{if} \ ((\mathsf{f}_1 \ x = \bot) ) \bot \ (\mathsf{f}_2 \ x = \bot)) \bot \ (\mathsf{f}_1 \ x, \mathsf{f}_2 \ x) \\ \end{array}
```

Figure 2: Bottom arrow definitions.

Figure 3: Transformation from a let-calculus with De-Bruijn-indexed bindings to arrow computations, for an arrow a. The type of a transformed program is $1 \leadsto_a X$, or an arrow from the empty stack to a value of type X.

XXX: motivate removal of bottom (reasons: won't need to propagate it; its absence will be convenient when computing preimages under functions that may diverge)

Lifting a bottom arrow computation $f:X\Rightarrow Y_\perp$ to the mapping arrow requires restricting f's domain to a subset of X for which f does not return \bot . It is helpful to have a standalone function $domain_\bot$ that computes such domains, so we define that first, and $lift_{map}$ in terms of $domain_\bot$:

$$\begin{aligned} \mathsf{domain}_{\perp} : (\mathsf{X} \Rightarrow \mathsf{Y}_{\perp}) \Rightarrow \mathsf{Set} \; \mathsf{X} \Rightarrow \mathsf{Set} \; \mathsf{X} \\ \mathsf{domain}_{\perp} \; \mathsf{f} \; \mathsf{A} \; := \; \mathsf{preimage} \; \mathsf{f}_{|\mathsf{A}} \; ((\mathsf{image} \; \mathsf{f} \; \mathsf{A}) \backslash \{\bot\}) \end{aligned} \tag{7}$$

$$\begin{aligned} & \mathsf{lift}_{\mathsf{map}} : (\mathsf{X} \Rightarrow \mathsf{Y}_{\perp}) \Rightarrow (\mathsf{X} \underset{\mathsf{map}}{\leadsto} \mathsf{Y}) \\ & \mathsf{lift}_{\mathsf{map}} \mathsf{ f } \mathsf{A} := \mathsf{let} \mathsf{ A}' := \mathsf{domain}_{\perp} \mathsf{ f } \mathsf{A} \\ & \mathsf{in} \mathsf{ f}|_{\mathsf{A}'} \end{aligned} \tag{8}$$

XXX: the default equality relation, which for $\lambda_{\rm ZFC}$ terms is alpha equivalence of reduced terms, will not do; need something more extensional

Definition 2 (Mapping arrow equivalence). Two mapping arrow computations $g_1: X_{\stackrel{\text{map}}{\rightarrow}} Y$ and $g_2: X_{\stackrel{\text{map}}{\rightarrow}} Y$ are equivalent, or $g_1 \equiv g_2$, when $g_1 A \equiv g_2 A$ for all $A \subseteq X$.

4.1 Distributive Laws

The clearest way to ensure that mapping arrow computations mean what we think they mean is to derive each combinator in a way that makes $lift_{map}$ distribute over bottom arrow computations. Formally, we require the following dis-

3 2013/7/3

tributive laws to hold:

$$lift_{map} (arr_{\perp} f) \equiv arr_{map} f \tag{9}$$

$$lift_{map} (pair_{\perp} f_1 f_2) \equiv pair_{map} (lift_{map} f_1) (lift_{map} f_2)$$
 (10)

$$lift_{map}$$
 (>>> $_{\perp}$ f₁ f₂) \equiv >>> $_{map}$ ($lift_{map}$ f₁) ($lift_{map}$ f₂) (11)

$$\begin{array}{l} \mathsf{lift}_{\mathsf{map}} \; (\mathsf{if}_{\perp} \; \mathsf{f}_1 \; \mathsf{f}_2 \; \mathsf{f}_3) \; \equiv \\ \mathsf{if}_{\mathsf{map}} \; (\mathsf{lift}_{\mathsf{map}} \; \mathsf{f}_1) \; (\lambda \, \mathsf{0}. \, \mathsf{lift}_{\mathsf{map}} \; (\mathsf{f}_2 \; \mathsf{0})) \; (\lambda \, \mathsf{0}. \, \mathsf{lift}_{\mathsf{map}} \; (\mathsf{f}_3 \; \mathsf{0})) \end{array} ^{(12)} \end{array}$$

Clearly $arr_{map} f := lift_{map} (arr_{\perp} f)$ meets (9). Figure 4 shows the result of deriving the other combinators from the bottom arrow using distributive laws.

Theorem 1 (mapping arrow correctness). lift $_{map}$ distributes over bottom arrow computations.

Proof. By structural induction; cases follow.

4.2 Case: Pairing

Starting with the left-hand side of (10), we first expand definitions. For any $f_1: X \Rightarrow Y_{\perp}$, $f_2: X \Rightarrow Z_{\perp}$, and $A \subseteq X$,

$$\begin{array}{l} \mathsf{lift}_{\mathsf{map}} \; \big(\mathsf{pair}_{\bot} \; \mathsf{f}_1 \; \mathsf{f}_2 \big) \; \mathsf{A} \\ & \equiv \; \mathsf{let} \quad \mathsf{f} \; := \; \lambda \mathsf{x}. \, \mathsf{if} \; \big(\mathsf{f}_1 \; \mathsf{x} = \bot \vee \mathsf{f}_2 \; \mathsf{x} = \bot \big) \; \bot \; \big\langle \mathsf{f}_1 \; \mathsf{x}, \mathsf{f}_2 \; \mathsf{x} \big\rangle \\ & \quad \mathsf{A}' \; := \; \mathsf{domain}_{\bot} \; \mathsf{f} \; \mathsf{A} \\ & \quad \mathsf{in} \; \; \mathsf{f}|_{\mathsf{A}'} \end{array} \tag{13}$$

Next, we replace the definition of A' with one that does not depend on f, and rewrite in terms of $lift_{map}$ f_1 and $lift_{map}$ f_2 :

$$\begin{array}{l} \mathsf{lift}_{\mathsf{map}} \left(\mathsf{pair}_{\bot} \ f_1 \ f_2 \right) \, A \\ & \equiv \ \mathsf{let} \ A_1 := \left(\mathsf{domain}_{\bot} \ f_1 \ A \right) \\ & A_2 := \left(\mathsf{domain}_{\bot} \ f_2 \ A \right) \\ & A' := A_1 \cap A_2 \\ & \mathsf{in} \ \lambda x \in A'. \left\langle f_1 \ x, f_2 \ x \right\rangle \\ & \equiv \ \mathsf{let} \ g_1 := \mathsf{lift}_{\mathsf{map}} \ f_1 \ A \\ & g_2 := \mathsf{lift}_{\mathsf{map}} \ f_2 \ A \\ & A' := \left(\mathsf{domain} \ g_1 \right) \cap \left(\mathsf{domain} \ g_2 \right) \\ & \mathsf{in} \ \lambda x \in A'. \left\langle g_1 \ x, g_2 \ x \right\rangle \\ & \equiv \ \left\langle \mathsf{lift}_{\mathsf{map}} \ f_1 \ A, \mathsf{lift}_{\mathsf{map}} \ f_2 \ A \right\rangle_{\mathsf{map}} \end{array} \tag{14} \end{array}$$

Substituting g_1 for $lift_{map}$ f_1 and g_2 for $lift_{map}$ f_2 gives a definition for $pair_{map}$ (Figure 4) for which (10) holds.

4.3 Case: Composition

The derivation of \gg_{map} is similar to that of $pair_{map}$ but a little more involved.

XXX: include it?

4.4 Case: Conditional

The derivation of if_{map} needs some care to maintain laziness of conditional branches in the presence of recursion.

We will use as an example the following bottom arrow computation, which returns true when applied to true and diverges on false:

halts-on-true_{$$\perp$$} := if _{\perp} id (λ 0. id) (λ 0. halts-on-true _{\perp}) (15)

Its corresponding mapping arrow computation should diverge only if applied to a set containing false.

Starting with the left-hand-side of (12), we expand definitions, and simplify f by restricting it to a domain for which

 $f_1 \times cannot \text{ be } \perp$:

$$\begin{array}{l} \mbox{lift}_{\mbox{\scriptsize map}} \mbox{ (if}_{\bot} \mbox{ } f_1 \mbox{ } f_2 \mbox{ } f_3 \mbox{ } A \\ & \equiv \mbox{\scriptsize let} \quad f := \lambda x. \mbox{\scriptsize case} \mbox{\scriptsize } f_1 \mbox{\scriptsize x} \\ & \qquad \qquad \mbox{\scriptsize true} \implies f_2 \mbox{\scriptsize 0} \mbox{\scriptsize x} \\ & \qquad \qquad \mbox{\scriptsize false} \implies f_3 \mbox{\scriptsize 0} \mbox{\scriptsize x} \\ & \qquad \mbox{\scriptsize else} \implies \bot \\ A' := \mbox{\scriptsize domain}_{\bot} \mbox{\scriptsize f} \mbox{\scriptsize A} \\ & \qquad \mbox{\scriptsize in} \mbox{\scriptsize f}|_{A'} \\ & \equiv \mbox{\scriptsize let} \mbox{\scriptsize A2} := \mbox{\scriptsize preimage} \mbox{\scriptsize f}_1|_A \mbox{\scriptsize frue} \} \\ & \qquad \mbox{\scriptsize A3} := \mbox{\scriptsize preimage} \mbox{\scriptsize f}_1|_A \mbox{\scriptsize false} \} \\ & \qquad \mbox{\scriptsize f} := \lambda x. \mbox{\scriptsize if} \mbox{\scriptsize } (f_1 \mbox{\scriptsize x}) \mbox{\scriptsize (f_3 \mbox{\scriptsize 0} \mbox{\scriptsize x})} \\ & \qquad \mbox{\scriptsize A'} := \mbox{\scriptsize domain}_{\bot} \mbox{\scriptsize f} \mbox{\scriptsize (A_2 \cup A_3)} \\ & \qquad \mbox{\scriptsize in} \mbox{\scriptsize f}|_{A'} \end{array} \label{eq:approx}$$

It is tempting at this point to finish by simply converting bottom arrow computations to the mapping arrow; i.e.

$$\begin{array}{l} \mathsf{lift}_{\mathsf{map}} \; \big(\mathsf{if}_{\perp} \; f_1 \; f_2 \; f_3 \big) \; \mathsf{A} \\ \equiv \; \mathsf{let} \quad \mathsf{g}_1 := \mathsf{lift}_{\mathsf{map}} \; f_1 \; \mathsf{A} \\ \qquad \qquad \mathsf{A}_2 := \mathsf{preimage} \; \mathsf{g}_1 \; \{\mathsf{true}\} \\ \qquad \qquad \mathsf{A}_3 := \mathsf{preimage} \; \mathsf{g}_1 \; \{\mathsf{false}\} \\ \qquad \qquad \mathsf{g}_2 := \mathsf{lift}_{\mathsf{map}} \; \big(f_2 \; 0 \big) \; \mathsf{A}_2 \\ \qquad \qquad \mathsf{g}_3 := \mathsf{lift}_{\mathsf{map}} \; \big(f_3 \; 0 \big) \; \mathsf{A}_3 \\ \qquad \qquad \mathsf{A}' := \big(\mathsf{domain} \; \mathsf{g}_2 \big) \cup \big(\mathsf{domain} \; \mathsf{g}_3 \big) \\ \qquad \qquad \mathsf{in} \; \; \lambda \mathsf{x} \in \mathsf{A}'. \, \mathsf{if} \; \big(\mathsf{g}_1 \; \mathsf{x} \big) \; \big(\mathsf{g}_2 \; \mathsf{x} \big) \; \big(\mathsf{g}_3 \; \mathsf{x} \big) \end{array} \right. \end{array} \tag{17}$$

This is close to correct. Unfortunately, for halts-on-true_ \perp , computing $g_3 := lift_{map}$ (f₃ 0) A₃ always diverges. Wrapping the branch computations g_2 and g_3 in thunks will not help because A' is computed from their domains.

Note that the "true" branch needs to be taken only if A_2 is nonempty; similarly for the "false" branch and A_3 . Further, applying a mapping arrow computation to \varnothing should always yield the empty mapping \varnothing . We can therefore maintain laziness in conditional branches by applying lift_{map} (f_2 0) and lift_{map} (f_3 0) only to nonempty sets, using

$$lazy_{map} : (X_{map} Y) \Rightarrow (X_{map} Y)$$

$$lazy_{map} f A := if (A = \emptyset) \emptyset (f A)$$
(18)

In terms of $lazy_{map}$, we have

$$\begin{array}{l} \mathsf{lift}_{\mathsf{map}} \; \big(\mathsf{if}_{\bot} \; f_1 \; f_2 \; f_3 \big) \; A \\ & \equiv \; \mathsf{let} \quad \mathsf{g}_1 := \mathsf{lift}_{\mathsf{map}} \; f_1 \; A \\ & \mathsf{g}_2 := \mathsf{lazy}_{\mathsf{map}} \; \big(\mathsf{lift}_{\mathsf{map}} \; (f_2 \; 0) \big) \; \big(\mathsf{preimage} \; \mathsf{g}_1 \; \big\{\mathsf{true}\big\} \big) \\ & \mathsf{g}_3 := \mathsf{lazy}_{\mathsf{map}} \; \big(\mathsf{lift}_{\mathsf{map}} \; (f_3 \; 0) \big) \; \big(\mathsf{preimage} \; \mathsf{g}_1 \; \big\{\mathsf{false}\big\} \big) \\ & \mathsf{A}' := \; \big(\mathsf{domain} \; \mathsf{g}_2\big) \cup \big(\mathsf{domain} \; \mathsf{g}_3\big) \\ & \mathsf{in} \; \; \lambda \mathsf{x} \in \mathsf{A}' . \; \mathsf{if} \; \big(\mathsf{g}_1 \; \mathsf{x}\big) \; \big(\mathsf{g}_2 \; \mathsf{x}\big) \; \big(\mathsf{g}_3 \; \mathsf{x}\big) \\ & \equiv \; \mathsf{let} \; \; \mathsf{g}_1 := \mathsf{lift}_{\mathsf{map}} \; f_1 \; \mathsf{A} \\ & \mathsf{g}_2 := \mathsf{lazy}_{\mathsf{map}} \; \big(\mathsf{lift}_{\mathsf{map}} \; \big(\mathsf{f}_2 \; 0\big)\big) \; \big(\mathsf{preimage} \; \mathsf{g}_1 \; \big\{\mathsf{true}\big\} \big) \\ & \mathsf{g}_3 := \mathsf{lazy}_{\mathsf{map}} \; \big(\mathsf{lift}_{\mathsf{map}} \; \big(\mathsf{f}_3 \; 0\big)\big) \; \big(\mathsf{preimage} \; \mathsf{g}_1 \; \big\{\mathsf{false}\big\} \big) \end{array}$$

For halts-on-true_ \perp , lazy_{map} (lift_{map} (f₃ 0)) A₃ does not diverge when A₃ is empty.

Substituting g_1 for lift_{map} f_1 , g_2 0 for lift_{map} $(f_2$ 0), and g_3 0 for lift_{map} $(f_3$ 0) gives a definition for if_{map} (Figure 4) for which (12) holds.

4.5 Super-Saver Theorems

4

in $g_2 \uplus_{\mathsf{map}} g_3$

The following two theorems are easy consequences of the fact that $lift_{map}$ distributes over bottom arrow computations.

Corollary 1. arr_{map} , $pair_{map}$ and \gg_{map} define an arrow.

Corollary 2. Let $f: X \Rightarrow Y_{\perp}$ and $g: X \underset{\mathsf{map}}{\leadsto} Y$ its corresponding mapping arrow computation. For all $A \subseteq X$, $g \in A$ diverges if and only if there exists an $x \in A$ for which $f \times diverges$.

```
X \underset{man}{\leadsto} Y ::= Set X \Rightarrow (X \rightarrow Y)
                                                                                                                                                                                                                \mathsf{if}_{\mathsf{map}} : (\mathsf{X}_{\stackrel{\mathsf{nop}}{\mathsf{map}}} \, \mathsf{Bool}) \Rightarrow (1 \Rightarrow (\mathsf{X}_{\stackrel{\mathsf{nop}}{\mathsf{map}}} \, \mathsf{Y})) \Rightarrow (1 \Rightarrow (\mathsf{X}_{\stackrel{\mathsf{nop}}{\mathsf{map}}} \, \mathsf{Y})) \Rightarrow (\mathsf{X}_{\stackrel{\mathsf{nop}}{\mathsf{map}}} \, \mathsf{Y})
                                                                                                                                                                                                                if_{map}\ g_1\ g_2\ g_3\ A\ :=
arr_{map}: (X \Rightarrow Y) \Rightarrow (X_{map} \xrightarrow{Y})
                                                                                                                                                                                                                        let g_1' := g_1 A
                                                                                                                                                                                                                                      g_2' := \mathsf{lazy}_{\mathsf{map}} \; (g_2 \; 0) \; (\mathsf{preimage} \; g_1' \; \{\mathsf{true}\})
arr_{map} f A := lift_{map} (arr_{\perp} f)

                                                                                                                                                                                                               lazy_{map} g A := if (A = \emptyset) \emptyset (g A)
```

Figure 4: Mapping arrow definitions.

5. Lazy Preimage Mappings

On a computer, we will not often have the luxury of testing each function input to see whether it belongs in a preimage set. Even for finite domains, doing so is often intractable.

If we wish to compute with infinite sets in the language implementation, we will need an abstraction that makes it easy to replace computation on points with computation on sets. Therefore, in the preimage arrow, we will confine computation on points to *lazy preimage mappings*, or just *preimage mappings*, for which application is like applying preimage. The type is

$$X \underset{\text{pre}}{\rightharpoonup} Y ::= \langle \text{Set } Y, \text{Set } Y \Rightarrow \text{Set } X \rangle$$
 (20)

Converting a mapping to a lazy preimage mapping:

$$\begin{array}{l} \mathsf{pre} : (\mathsf{X} \rightharpoonup \mathsf{Y}) \Rightarrow (\mathsf{X} \xrightarrow[\mathsf{pre}]{} \mathsf{Y}) \\ \mathsf{pre} \ \mathsf{g} \ := \ \mathsf{let} \ \ \mathsf{Y}' := \mathsf{range} \ \mathsf{g} \\ \mathsf{p} := \lambda \, \mathsf{B}. \ \mathsf{preimage} \ \mathsf{g} \ \mathsf{B} \\ \mathsf{in} \ \ \langle \mathsf{Y}', \mathsf{p} \rangle \end{array} \tag{21}$$

Applying a preimage mapping to any subset of its codomain:

$$\begin{array}{l} \mathsf{pre}\text{-}\mathsf{ap}: (\mathsf{X} \underset{\mathsf{pre}}{\rightharpoonup} \mathsf{Y}) \Rightarrow \mathsf{Set} \; \mathsf{Y} \Rightarrow \mathsf{Set} \; \mathsf{X} \\ \mathsf{pre}\text{-}\mathsf{ap} \; \langle \mathsf{Y}', \mathsf{p} \rangle \; \mathsf{B} \; := \; \mathsf{p} \; (\mathsf{B} \cap \mathsf{Y}') \end{array} \tag{22}$$

The necessary property here is that using pre-ap to compute preimages is the same as computing them from a mapping using preimage.

Theorem 2 (pre-ap computes preimages). Let $g \in X \rightharpoonup Y$. For all $B \subseteq Y$, pre-ap (pre g) B = preimage g B.

Proof.

pre-ap (pre g) B = let
$$Y' := range g$$

 $p := \lambda B$. preimage g B
in $p(B \cap Y')$
= preimage g $(B \cap (range g))$
= preimage g B

Figure 5 defines more operations on preimage mappings, including pairing, composition, and disjoint union operations corresponding to the mapping operations in Figure 1. Roughly, the correspondence is that **pre** distributes over mapping operations to yield preimage mapping operations. The precise correspondence is the subject of the next three

theorems, which will be used to derive the preimage arrow from the mapping arrow.

First, we need a new notion of equivalence.

Definition 3. Two preimage mappings $h_1: X \xrightarrow[pre]{} Y$ and $h_2: X \xrightarrow[pre]{} Y$ are equivalent, or $h_1 \equiv h_2$, when pre-ap $h_1 B = pre$ -ap $h_2 B$ for all $B \subseteq Y$.

XXX: define equivalence in terms of equivalence, check observational equivalence in the proofs (specifically divergence)

5.1 Preimage Mapping Pairing

XXX: moar wurds in this section

Lemma 1 (preimage distributes over $\langle \cdot, \cdot \rangle_{map}$ and (\times)). Let $g_1 \in X \rightharpoonup Y_1$ and $g_2 \in X \rightharpoonup Y_2$. For all $B_1 \subseteq Y_1$ and $B_2 \subseteq Y_2$, preimage $\langle g_1, g_2 \rangle_{map}$ $(B_1 \times B_2) = (preimage g_1 B_1) \cap (preimage g_2 B_2)$.

Theorem 3 (pre distributes over $\langle \cdot, \cdot \rangle_{map}$). Let $g_1 \in X \rightharpoonup Y_1$ and $g_2 \in X \rightharpoonup Y_2$. Then pre $\langle g_1, g_2 \rangle_{map} \equiv \langle \text{pre } g_1, \text{pre } g_2 \rangle_{pre}$.

Proof. Let $\langle Y_1', p_1 \rangle := pre \ g_1$ and $\langle Y_2', p_2 \rangle := pre \ g_2$. Starting from the right-hand side, for all $B \in Y_1 \times Y_2$,

5.2 Preimage Mapping Composition

XXX: moar wurds in this section

5 2013/7/3

$$\begin{array}{lll} X \underset{\overline{pre}}{\rightharpoonup} Y ::= \langle Set \ Y, Set \ Y \Rightarrow Set \ X \rangle & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_2) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_2) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_2) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & \langle \cdot, \cdot \rangle_{pre} : (X \underset{\overline{pre}}{\rightharpoonup} Y_1) \Rightarrow (X \underset{\overline{pre}}{\rightharpoonup} Y_1 \times Y_2) \\ & p := \lambda B. \bigcup_{\langle y_1, y_2 \rangle \in B} (p_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (Y'_1, p_1), \langle Y'_2, p_2 \rangle_{pre} : = let \ Y'_1 \times Y_2 \times Y_2 \\ & p := \lambda B. \bigcup_{\langle y_1, y_2 \rangle \in B} (p_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (Y'_1, p_1), \langle Y'_2, p_2 \rangle_{pre} : = let \ Y'_1 \times Y_2 \times Y_2 \times Y_2 \\ & p := \lambda B. \bigcup_{\langle y_1, y_2 \rangle \in B} (p_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (Y'_1, p_1), \langle Y'_2, p_2 \rangle_{pre} : (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (p_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2 \ \{y_2\}) \\ & (P_1 \ \{y_1\}) \cap (P_2$$

Figure 5: Lazy preimage mappings and operations.

Lemma 2 (preimage distributes over (\circ_{map})). Let $g_1 \in X \rightharpoonup Y$ and $g_2 \in Y \rightharpoonup Z$. For all $C \subseteq Z$, preimage $(g_2 \circ_{map} g_1)$ $C = preimage g_1$ (preimage g_2 C).

Theorem 4 (pre distributes over (\circ_{map})). Let $\mathsf{g}_1 \in \mathsf{X} \rightharpoonup \mathsf{Y}$ and $\mathsf{g}_2 \in \mathsf{Y} \rightharpoonup \mathsf{Z}$. Then $\mathsf{pre} (\mathsf{g}_2 \circ_{\mathsf{map}} \mathsf{g}_1) \equiv (\mathsf{pre} \ \mathsf{g}_2) \circ_{\mathsf{pre}} (\mathsf{pre} \ \mathsf{g}_1)$.

Proof. Let $\langle Z',p_2\rangle:=pre~g_2.$ Starting from the right-hand side, for all $C\subseteq Z,$

$$\begin{array}{ll} \mathsf{pre-ap} \; ((\mathsf{pre} \; \mathsf{g}_2) \circ_{\mathsf{pre}} (\mathsf{pre} \; \mathsf{g}_1)) \; \mathsf{C} \\ &= \; \mathsf{let} \; \; \mathsf{h} := \lambda \mathsf{C}. \; \mathsf{pre-ap} \; (\mathsf{pre} \; \mathsf{g}_1) \; (\mathsf{p}_2 \; \mathsf{C}) \\ &\quad \mathsf{in} \; \; \mathsf{h} \; (\mathsf{C} \cap \mathsf{Z}') \\ &= \; \mathsf{pre-ap} \; (\mathsf{pre} \; \mathsf{g}_1) \; (\mathsf{p}_2 \; (\mathsf{C} \cap \mathsf{Z}')) \\ &= \; \mathsf{pre-ap} \; (\mathsf{pre} \; \mathsf{g}_1) \; (\mathsf{pre-ap} \; (\mathsf{pre} \; \mathsf{g}_2) \; \mathsf{C}) \\ &= \; \mathsf{preimage} \; \mathsf{g}_1 \; (\mathsf{preimage} \; \mathsf{g}_2 \; \mathsf{C}) \\ &= \; \mathsf{preimage} \; (\mathsf{g}_2 \circ_{\mathsf{map}} \; \mathsf{g}_1) \; \mathsf{C} \\ &= \; \mathsf{pre-ap} \; (\mathsf{pre} \; (\mathsf{g}_2 \circ_{\mathsf{map}} \; \mathsf{g}_1)) \; \mathsf{C} \end{array}$$

5.3 Preimage Mapping Disjoint Union

XXX: moar wurds in this section

Lemma 3 (preimage distributes over (\uplus_{map})). Let $g_1 \in X \rightharpoonup Y$ and $g_2 \in X \rightharpoonup Y$ be disjoint mappings. For all $B \subseteq Y$, preimage $(g_1 \uplus_{map} g_2) B = (preimage g_1 B) \uplus (preimage g_2 B)$.

Theorem 5 (pre distributes over (\uplus_{map})). Let $g_1 \in X \rightharpoonup Y$ and $g_2 \in X \rightharpoonup Y$ have disjoint domains. Then pre $(g_1 \uplus_{map} g_2) \equiv (pre \ g_1) \uplus_{pre} (pre \ g_2)$.

 $\label{eq:proof.proof.} \begin{array}{l} \textit{Proof.} \ \, \text{Let} \ Y_1' := \mathsf{pre-range} \ \, (\mathsf{pre} \ \mathsf{g}_1) \ \, \text{and} \ \, Y_2' := \mathsf{pre-range} \ \, (\mathsf{pre} \ \mathsf{g}_2). \\ \text{Starting from the right-hand side, for all } \ \, \mathsf{B} \subseteq \mathsf{Y}, \\ \mathsf{pre-ap} \ \, ((\mathsf{pre} \ \mathsf{g}_1) \uplus_{\mathsf{pre}} (\mathsf{pre} \ \mathsf{g}_2)) \ \, \mathsf{B} \end{array}$

6. Deriving the Preimage Arrow

XXX: intro

6

$$X \underset{\text{pre}}{\leadsto} Y ::= \text{Set } X \Rightarrow (X \underset{\text{pre}}{\rightharpoonup} Y)$$
 (23)

$$\begin{aligned}
& \mathsf{lift}_{\mathsf{pre}} : (\mathsf{X}_{\stackrel{\leadsto}{\mathsf{map}}} \mathsf{Y}) \Rightarrow (\mathsf{X}_{\stackrel{\leadsto}{\mathsf{pre}}} \mathsf{Y}) \\
& \mathsf{lift}_{\mathsf{pre}} \ \mathsf{g} \ \mathsf{A} \ := \ \mathsf{pre} \ (\mathsf{g} \ \mathsf{A})
\end{aligned} \tag{24}$$

Definition 4 (Preimage arrow equivalence). Two preimage arrow computations $h_1: X_{\widetilde{pre}} Y$ and $h_2: X_{\widetilde{pre}} Y$ are equivalent, or $h_1 \equiv h_2$, when $h_1 A \equiv h_2 A$ for all $A \subseteq X$.

6.1 Distributive Laws

XXX: ensuring lift $_{pre}$ distributes over mapping arrow computations is awe some...

Formally, we require the following distributive laws to hold:

$$lift_{pre} (arr_{map} f) \equiv arr_{pre} f$$
 (25)

$$lift_{pre} (pair_{map} g_1 g_2) \equiv pair_{pre} (lift_{pre} g_1) (lift_{pre} g_2)$$
 (26)

$$lift_{pre}$$
 (\ggg_{map} g_1 g_2) \equiv \ggg_{pre} ($lift_{pre}$ g_1) ($lift_{pre}$ g_2) (27)

$$\begin{array}{l} \mathsf{lift}_{\mathsf{pre}} \; (\mathsf{if}_{\mathsf{map}} \; \mathsf{g}_1 \; \mathsf{g}_2 \; \mathsf{g}_3) \; \equiv \\ \mathsf{if}_{\mathsf{pre}} \; (\mathsf{lift}_{\mathsf{pre}} \; \mathsf{g}_1) \; (\lambda \, \mathsf{0}. \, \mathsf{lift}_{\mathsf{pre}} \; (\mathsf{g}_2 \; \mathsf{0})) \; (\lambda \, \mathsf{0}. \, \mathsf{lift}_{\mathsf{pre}} \; (\mathsf{g}_3 \; \mathsf{0})) \end{array} \tag{28}$$

```
\begin{array}{lll} X_{\overrightarrow{pre}}\,Y::=\operatorname{Set}\,X\Rightarrow(X_{\overrightarrow{pre}}\,Y) & & & & & & & & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\overrightarrow{pre}}\,Y)\Rightarrow(X_{\overrightarrow{pre}}\,Y) & & & & & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\overrightarrow{pre}}\,Y)\Rightarrow(X_{\overrightarrow{pre}}\,Y) & & & & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\overrightarrow{pre}}\,Y)\Rightarrow(X_{\overrightarrow{pre}}\,Y) & & & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\overrightarrow{pre}}\,Y)\Rightarrow(X_{\overrightarrow{pre}}\,Y) & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\overrightarrow{pre}}\,Y)\Rightarrow(X_{\overrightarrow{pre}}\,Y) & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\overrightarrow{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y) & & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y) & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y) & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y) & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y) & & \\ \operatorname{if}_{\operatorname{pre}}\,:\,(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X_{\operatorname{pre}}\,Y)\Rightarrow(X
```

Figure 6: Preimage arrow definitions.

Clearly arr_{pre} $f := lift_{pre}$ (arr_{map} f) meets (25). Figure 6 shows the result of deriving the other combinators from the mapping arrow using distributive laws.

Theorem 6 (preimage arrow correctness). $lift_{pre}$ distributes over mapping arrow computations.

Proof. By structural induction; cases follow. \Box

6.2 Case: Pairing

Starting with the left-hand side of (26), we expand definitions, apply Theorem 3, and rewrite in terms of lift_{pre}:

$$\begin{array}{l} \mathsf{pre-ap} \ (\mathsf{lift}_\mathsf{pre} \ (\mathsf{pair}_\mathsf{map} \ \mathsf{g}_1 \ \mathsf{g}_2) \ \mathsf{A}) \ \mathsf{B} \\ & \equiv \ \mathsf{pre-ap} \ (\mathsf{pre} \ \langle \mathsf{g}_1 \ \mathsf{A}, \mathsf{g}_2 \ \mathsf{A} \rangle_\mathsf{map}) \ \mathsf{B} \\ & \equiv \ \mathsf{pre-ap} \ \langle \mathsf{pre} \ (\mathsf{g}_1 \ \mathsf{A}), \mathsf{pre} \ (\mathsf{g}_2 \ \mathsf{A}) \rangle_\mathsf{pre} \ \mathsf{B} \\ & \equiv \ \mathsf{pre-ap} \ \langle \mathsf{lift}_\mathsf{pre} \ \mathsf{g}_1 \ \mathsf{A}, \mathsf{lift}_\mathsf{pre} \ \mathsf{g}_2 \ \mathsf{A} \rangle_\mathsf{pre} \ \mathsf{B} \end{array}$$

Substituting h_1 for lift_{pre} g_1 and h_2 for lift_{pre} g_2 , and removing the application of pre-ap from both sides of the equivalence gives a definition of pair_{pre} (Figure 6) for which (26) holds.

6.3 Case: Composition

Starting with the left-hand side of (27), we expand definitions, apply Theorem 4 and rewrite in terms of lift_{pre}:

$$\begin{array}{lll} \text{pre-ap (lift}_{\text{pre}} & (\ggg_{\text{map}} g_1 \ g_2) \ A) \ C \\ & \equiv & \text{let} \ \ g_1' := g_1 \ A \\ & \quad \ \ g_2' := g_2 \ (\text{range} \ g_1') \\ & \quad \ \ \text{in pre-ap (pre } (g_2' \circ_{\text{map}} g_1')) \ C \\ & \equiv & \text{let} \ \ g_1' := g_1 \ A \\ & \quad \ \ g_2' := g_2 \ (\text{range} \ g_1') \\ & \quad \ \ \text{in pre-ap ((pre \ g_1') \circ_{\text{pre}} (\text{pre} \ g_2'))} \ C \\ & \equiv & \text{let} \ \ h_1 := & \text{lift}_{\text{pre}} \ g_1 \ A \\ & \quad \ \ h_2 := & \text{lift}_{\text{pre}} g_2 \ (\text{pre-range} \ h_1) \\ & \quad \ \ \text{in pre-ap (} h_2 \circ_{\text{pre}} h_1) \ C \end{array} \tag{29} \\ \end{array}$$

Substituting h_1 for lift_{pre} g_1 and h_2 for lift_{pre} g_2 , and removing the application of pre-ap from both sides of the equivalence gives a definition of \ggg_{pre} (Figure 6) for which (27) holds.

6.4 Case: Conditional

Starting with the left-hand side of (28), we expand terms, apply Theorem 5, rewrite in terms of lift_{pre}, and apply

Theorem 2 in the definitions of h_2 and h_3 :

Replacing mappings with lazy preimage mappings requires removing $lazy_{map}$. First, we define $lazy_{pre}$ as in Figure 6. It is not hard to check that

$$lift_{pre} (lazy_{map} g) \equiv lazy_{pre} (lift_{pre} g)$$
 (30)

In terms of $\mathsf{lazy}_\mathsf{pre},$ we have

$$\begin{array}{l} \mathsf{pre\text{-}ap} \; \big(\mathsf{lift}_{\mathsf{pre}} \; \big(\mathsf{if}_{\mathsf{map}} \; \mathsf{g}_1 \; \mathsf{g}_2 \; \mathsf{g}_3 \big) \; \mathsf{A} \big) \; \mathsf{B} \\ & \equiv \; \mathsf{let} \; \; \mathsf{h}_1 \; := \; \mathsf{lift}_{\mathsf{pre}} \; \mathsf{g}_1 \; \mathsf{A} \\ & \; \; \mathsf{h}_2 \; := \; \mathsf{lazy}_{\mathsf{pre}} \; \big(\mathsf{lift}_{\mathsf{pre}} \; \big(\mathsf{g}_2 \; \mathsf{0} \big) \big) \; \big(\mathsf{pre\text{-}ap} \; \mathsf{h}_1 \; \big\{ \mathsf{true} \big\} \big) \\ & \; \; \mathsf{h}_3 \; := \; \mathsf{lazy}_{\mathsf{pre}} \; \big(\mathsf{lift}_{\mathsf{pre}} \; \big(\mathsf{g}_3 \; \mathsf{0} \big) \big) \; \big(\mathsf{pre\text{-}ap} \; \mathsf{h}_1 \; \big\{ \mathsf{false} \big\} \big) \\ & \; \; \mathsf{in} \; \; \mathsf{pre\text{-}ap} \; \big(\mathsf{h}_2 \; \uplus_{\mathsf{pre}} \; \mathsf{h}_3 \big) \; \mathsf{B} \end{array}$$

Substituting h_1 for lift_{pre} g_1 , h_2 0 for lift_{pre} $(g_2$ 0) and h_3 0 for lift_{pre} $(g_3$ 0), and removing the application of pre-ap from both sides of the equivalence gives a definition of if_{pre} (Figure 6) for which (28) holds.

6.5 Super-Saver Theorems

7

The following two theorems are easy consequences of the fact that lift_{pre} distributes over mapping arrow computations.

Corollary 3. arr_{pre}, pair_{pre} and >>>_{pre} define an arrow.

Corollary 4. Let $g: X_{\stackrel{\leadsto}{map}} Y$ and $h: X_{\stackrel{\leadsto}{pre}} Y$ its corresponding preimage arrow computation. For all $A \subseteq X$ and $B \subseteq Y$, pre-ap $(h \ A) \ B \equiv preimage \ (g \ A) \ B$.

7. Computable Approximation

8. Preimages of Partial Functions
